Analysis Results

Cognitive Assessment

ALZHEIMER'S RISK SCORE

65

Moderate Risk

Based on hippocampal volume and cortical thickness measurements

Risk Assessment

65%

Hippocampal Volume

2.1 cm³

Cortical Thickness

2.4 mm

Risk Factors

Age

Moderate

Family History

High

Cognitive Decline

Moderate

Brain Atrophy

Low

Lifestyle Factors

Low

Analysis Summary

Initial analysis pending. Please update patient information and add diagnostic notes.

Recommendations

Treatment Plan

Based on the analysis results, we recommend a comprehensive treatment plan that includes cognitive exercises, medication review, and regular follow-up appointments. The patient should be monitored for changes in cognitive function and adjustments to the treatment plan should be made accordingly.

Lifestyle Modifications

We recommend the following lifestyle modifications to help manage symptoms and slow disease progression:

- Regular physical exercise (at least 30 minutes daily)
- Mediterranean diet rich in omega-3 fatty acids
- Cognitive stimulation activities and brain exercises
- Adequate sleep (7-8 hours nightly)
- Stress reduction techniques such as meditation
- Social engagement and regular interaction

Follow-up Schedule

We recommend the following follow-up schedule to monitor progress and adjust treatment as needed:

- Neurological assessment: Every 3 months
- Cognitive function testing: Every 6 months
- MRI brain scan: Annually
- Medication review: Monthly for the first 3 months, then quarterly

For questions or concerns, please contact your healthcare provider.
